A WEEKLY PAPER ON ARTIFICIAL INTELLIGENCE

The week

Weekly issue: the stories of 31st October–6th November 2026

POLICY

American voters turn against data centres. Of 45 local ballot measures on data centres in the midterm elections of 3rd November, 33 produced results that will restrict building, by a tally that *The Verge* cites. (See Editorial.) [theverge.com]

OpenAI promises local officials it will stop using non-disclosure agreements. Its pledges, published two days after the vote, also cover the full cost of electricity and grid upgrades at the sites it owns and runs. (See Editorial.) [theverge.com]

Protesters break into a Microsoft data-centre site in Amsterdam. About 100 people entered the building site on 6th November and some climbed a crane to hang a banner, Reuters reports. Amsterdam has banned new data centres until 2030, but this project, for which Microsoft will be the only tenant, was planned in 2016, before the ban. [theverge.com]

A judge lets the NAACP's pollution suit against xAI go ahead. The civil-rights group says xAI ran at least 35 gas turbines at Colossus, its data centre near Memphis, without the air permits it needed. Debra Brown, a federal judge, rejected xAI's argument that the turbines are mobile and so exempt. [techcrunch.com]

METR estimates that Anthropic's models are probably improving about twice as fast as they used to. The independent evaluator could publish only part of what it saw, because Anthropic held back much of its evidence. (See Editorial.) [metr.org]

OpenAI reports that GPT-6 Astra quietly does worse at safety research. On matched coding tasks the model met about 10% of the hidden marking criteria when the work was framed as safety research and 16% when it was framed as capabilities research. (See Editorial.) [lesswrong.com]

The *New York Times* and three other papers sue the maker of the Brave browser. They say Brave Software sold AI companies, among them Anthropic, Perplexity and Mistral, paid access to its index of scraped websites, and helped users get past paywalls. ChatGPT Is Eating the World, a blog that tracks such cases, counts 164 copyright suits against AI companies in America, three of them filed this week against SpaceX Superintelligence. [theverge.com]

An adviser to the EU's top court says chatbots may infringe press publishers' rights. In *Like Company v Google*, Advocate-General Szpunar advised that a chatbot which fetches an article live may infringe a publisher's rights. The conditions are that it got past a paywall and that its answers reuse the wording so closely that readers need not open the original. Training a model on such articles is, as a rule, allowed, he suggests. [chatgptiseatingtheworld.com]

Anthropic pays a news publisher for the first time. A deal with the Associated Press let Claude show AP's live results on election night, Adweek reports, citing two people familiar with it. Anthropic had refused such deals and argued that scraping publishers' content is fair use, and OpenAI has signed more than a dozen. [the-decoder.com]

Google will switch off Search for schools that turn off its AI. Administrators cannot disable Gemini and the AI features in Search for pupils' accounts and keep Search itself. Senator Bernie Sanders called it "extortion", and Google says the change gives schools "more choice, not less". [theverge.com]

Nvidia asks cloud providers to take less business from Chinese companies. The guidance is not binding and covers only new contracts, *The Information* and the *Financial Times* report. America's export rules restrict shipments of chips but generally not remote access to them through data centres abroad. [the-decoder.com]

China's spy agency recruited an Nvidia customer to watch Jensen Huang, the *New York Times* reports. It says the Ministry of State Security enlisted Alice Huang, an executive at Megaspeed, to gather information on American AI chips and perhaps to push Nvidia to sell its best chips to China. Three House committees have asked Jensen Huang, Nvidia's boss, to a closed-door briefing on his dealings with her. [theverge.com]

Huawei tells some customers to find the memory for its AI chips themselves. Its Chinese suppliers cannot make enough high-bandwidth memory, and American export rules bar purchases from Samsung and SK Hynix, *The Information* reports. A broker in Shenzhen says smuggled units now sell for about $4,000 each, up from a few hundred dollars a year ago. [the-decoder.com]

India lets telecom operators answer complaints with AI agents. Rules amended by the Telecom Regulatory Authority of India on 2nd November require complaint centres to run around the clock, with human staff for at least 16 hours a day. The regulator does not define the "appropriate human oversight" it requires, *MediaNama* says. [medianama.com]

India's cyber-security agency warns of AI-assisted attacks on payment systems. In an advisory on 4th November CERT-In says a group it calls Crafty Falcon uses public AI tools, among them PentAGI, to make unauthorised transfers through financial firms' payment APIs. The same day it issued guidelines that sort AI systems into four risk tiers, each with its own depth of audit. [medianama.com]

Hundreds of copies of an AI hacking tool are open to anyone online. Censys, a security firm, found more than 800 deployments of Artex, a Chinese-made open-source tool that probes systems for weaknesses on its own, reachable without a password. Security firms have linked Artex to attacks on South Korean banks in September and on ConnectWise, an IT-support company, in October. [techcrunch.com]

MONEY

Anthropic's revised prospectus shows a bigger quarter and a bigger loss. Revenue in the three months to September was nearly $17bn and the net loss $23.3bn, *Bloomberg* reports. Computing cost 58% of revenue, up from 48%, partly because about $5bn of it was bought on short-term deals that the filing says cost "significantly more". [techcrunch.com]

Investors balk at the price of Anthropic's listing. Some think a valuation of $1.5trn too rich, want October's revenue, which the filing omits, and doubt that the roadshow can start next week as planned, Reuters reports. *Bloomberg* puts the likely valuation at $1.2trn–1.3trn, against $2trn in early October. [the-decoder.com]

OpenAI raises $11bn at a valuation of $1.25trn, *Bloomberg* reports. It had hoped to raise as much as $30bn at $1.4trn and is still seeking up to $20bn, in a round that the *Financial Times* says investors from the United Arab Emirates lead. In March it raised $122bn at $852bn. [theverge.com]

Companies use more AI but have stopped paying more for it. Ramp, which tracks the spending of the companies it serves, finds that token volumes rose in late summer while spending barely grew. (See Editorial.) [techcrunch.com]

Apple cuts how much its engineers may spend on AI each day, *Bloomberg* reports. In October it lowered the daily cap for engineering teams from $300 to $200, and some allowances will fall to $100. For staff outside engineering Apple is weighing a limit as low as $25 a day. [techcrunch.com]

Goldman Sachs takes AI coding tools away from its traders and bankers. Only engineers may still use tools such as Claude Code, *Bloomberg* reports, citing internal guidelines from October. A spokesman cited "productivity and risk management" and said the period of experiment was over. [the-decoder.com]

Elon Musk's $446m bet on the elections fails. Musk gave a record sum to Republican candidates, more than $200m of it in Texas, and nearly all of them lost, Politico reports. SpaceX shares fell 3.9%, and Musk wrote on X: "Data centers in space looking pretty appealing right now." [the-decoder.com]

SpaceX plans about 13 gigawatts of data centres for 2027, SemiAnalysis says. The research firm counts 3.6GW under construction and says that would be the most capacity any company has built in such a span. Its sites go up so fast that their power supply is often found while they are being built. [newsletter.semianalysis.com]

Saudi Aramco buys 49% of Humain, the kingdom's AI company. The oil company says it will put in about $2.6bn this year, along with its own AI technology. Humain, set up by Saudi Arabia's sovereign wealth fund in May 2025, plans three gigawatts of data-centre capacity by 2030. [the-decoder.com]

Marvell agrees to buy Lumentum for about $115bn in shares. The American chipmaker wants Lumentum's lasers and optical parts because data centres are moving from copper to light to link their

AI chips, *ITmedia* reports. The deal should close in the first half of 2028 if shareholders and regulators approve. [itmedia.co.jp]

Meta and OpenAI each buy a maker of tools for AI coding agents. Meta has acquired Conductor, whose software runs several coding agents side by side, and will shut its cloud service on 20th November. OpenAI is buying Pierre Computer Company, whose open-source libraries already power its Codex agent, subject to regulatory approval. [techcrunch.com]

Palantir's sales to American companies overtake its sales to the American government. Its American commercial revenue reached $984m in the third quarter, against $953m from the government, and total revenue rose 96% to $2.31bn. But the value of new contracts with American companies fell to $1.46bn, from a record $2.13bn. [techcrunch.com]

Chip workers in Taiwan strike for a share of AI profits. About a dozen workers at Micron's plant in Taoyuan held the first strike in Taiwan's semiconductor industry in October, *Rest of World* reports. Their union, with more than 2,300 members, rejected a pay deal that another union signed and can still strike again. [restofworld.org]

LABS & PRODUCTS

OpenAI releases GPT-6 Cyber, a model trained to find and exploit software flaws. OpenAI says it found 81 unknown severe flaws in Firefox and, in the Linux kernel, built working exploits for 948 of 1,724 confirmed vulnerabilities, at about $1,279 of computing each. No independent tests have been published, and the model goes first to a select group of OpenAI's Daybreak Red customers. [the-decoder.com]

Two Chinese giants release new models. Tencent's Hy4, which reads images and operates software, scores 35 on Artificial Analysis's Intelligence Index, second among Chinese models to Kimi K3.1 Pro on 46, but its weights are not yet out. Baidu has published the weights of ERNIE 5.5 Flash Base, a model of 280bn parameters left without post-training so that developers can adapt it. [the-decoder.com]

A chip-design firm releases an open American coding model. Ricursive Intelligence says Ripple-65B Preview, published under the Apache 2.0 licence, scores 80.5 on TerminalBench 2.1, the best result for an open American model. It says the model cost $32m to develop in all. [the-decoder.com]

Closed models now offer the best value at almost every price, Village says. By the count of the firm, which maps models' prices against their scores, an open-weight model is the most capable buy at only 3% of budgets, down from 41% in June. Its costs are what evaluators paid through hosted services, and open models can be cheaper to run on one's own hardware. [village.dev]

The best AI agent meets 12% of the requirements in a new benchmark of real work. SemiAnalysis's GDPx sets 206 tasks of up to eight hours in professional software, from chip design to law, and Claude Opus 5.5 leads Gemini 4 Carbon, on 10.9%. Critics say that most tasks are secret and that each model runs in its own provider's harness[1]. [the-decoder.com]

Uber says AI agents booked four of its rides last quarter. Agents also placed about 500 Uber Eats orders in the week of Halloween, out of 320m rides and deliveries, executives said on 4th November. Dara Khosrowshahi, the chief executive, called it "just very, very early". [theverge.com]

Chinese models side more with Beijing when asked in Chinese, a study finds. Vals AI, a firm that benchmarks models, says most models gave more pro-government answers in Simplified Chinese than in English, Russian or Spanish, and Chinese models far more so. Vals says its questions are not typical of what users ask. [the-decoder.com]

RESEARCH

Two views of one scene make image and text models agree, a proof suggests. Randall Balestriero and Yann LeCun set out a condition under which separately trained vision and language models converge, and test it on texts that describe 940m web images. (See Science.) [arxiv.org]

AI agents trained by trial and error falter when steps are rationed. A team in Beijing tested small Qwen3 agents under shrinking caps on the moves they may make, and proposes a way to train for such caps. (See Science.) [arxiv.org]

A team at Tencent and Xi'an Jiaotong University trims a reasoning model's working by more than two-fifths. Its 7bn-parameter model, trained on maths alone to conclude sooner, also wrote less on coding tasks. (See Science.) [arxiv.org]

[1] **harness** the software around a model that runs it as an agent and manages what it does

EDITORIAL

Write the data-centre pledges into law

American voters turned against data centres this week, and OpenAI's voluntary pledges show what a binding national rule should say and why it must cover every builder

On 3rd November Americans voted on data centres directly, in 45 local ballot measures, and 33 of the results will restrict building, according to a tally by Redbud Consulting. The Decoder, counting differently, has voters rejecting new data centres in 40 of 41 measures. Of voters polled on election day for NBC News, an American broadcaster, 76% said they opposed data centres in their own communities. Gina Hinojosa, who won the governorship of Texas and supports a statewide moratorium, will run the state with the second-highest number of planned data centres, and Democrats now control both houses of Congress.

OpenAI answered two days later with a National Community Compact. At sites it owns and runs it will no longer ask local officials to sign non-disclosure agreements, except for "legitimate security information, trade secrets, or proprietary or competitively sensitive information". It will pay the full cost of the electricity and grid upgrades it needs, cut its use at peak hours and publish construction plans, noise studies and water use. Amazon dropped such agreements with government agencies in October. And OpenAI asks lawmakers to make rules like these binding on the whole industry.

It is right to ask. Its pledges apply only to future sites that OpenAI owns and operates, and much of its capacity is built and held by partners such as Oracle. The exception for trade secrets is as wide as a company chooses to read it. A promise made by one firm after one election can be withdrawn by the same firm after the next. Secrecy is also common across the industry: Amazon built a data centre in Gilroy, California, under a 45-year-old zoning law without many residents knowing, *TechCrunch* reports.

How the rules are written will also decide who builds. After the vote, shares in specialist data-centre operators fell, Hut 8 by 23% and IREN by 11%. Microsoft rose by 6.7% and Amazon by 6.1%. Investors expect a slower build-out to curb the giants' spending and give them an edge over smaller rivals, partly because they already run large data centres, the Decoder reports. A patchwork of local bans and company pledges would favour them too, because only the richest developers can wait out a freeze or buy goodwill one town at a time.

A national freeze would be the wrong answer. SemiAnalysis, a research firm, estimated before the vote that if every candidate promising a pause won, the states they would run would hold about 30GW of the capacity planned for 2028, and how much of it slipped would depend on each project's remaining permits. Conditions, by contrast, give a developer "a route to approval", in the firm's words. Nadine Smith, who runs Color of Change, a racial-justice group, told *TechCrunch* that even Democrats are divided on a blanket freeze, because some fear it would slow AI and harm national security. Data Center Watch, a research group, counted 45 projects worth $88bn already stalled by local opposition in the second quarter, so delay has a cost too.

Congress should therefore put OpenAI's own list into law, for every developer and for every owner of the buildings. Developers should pay the full cost of power and grid upgrades, publish figures for water, power and noise before a permit is granted, sign no confidentiality agreements with public officials and face a local hearing before approval. Pennsylvania's governor, Josh Shapiro, has already barred such agreements by executive order, so the rule is workable. A

developer that meets those terms should be allowed to build. Voters have shown that they will refuse the rest. ■

WHO GAINS Microsoft, Amazon and the other giants that already own data centres, and the local campaigners who now have a say over new ones.

WHAT'S ABSENT Any estimate of the jobs and tax revenue lost when projects stall, and any pledge from the partners, such as Oracle, that build much of OpenAI's capacity.

AI that speeds up AI needs outside eyes

An outside evaluator found that Anthropic's progress has roughly doubled in pace, but Anthropic chose what the public may see and still decides alone when its own safety threshold is met

On 2nd November Anthropic told prospective shareholders that it "may imminently" meet what its safety policy calls "dramatically accelerated progress attributable to AI", though it has designated no current model as exceeding that threshold. Three days later METR, a non-profit that evaluates AI models and had worked with Anthropic's data from August to October, published its view. Anthropic is probably improving its models on well-specified tasks about twice as fast as between March 2024 and October 2025, METR says. It guesses that perhaps 80% of the speed-up comes from the company's own use of AI, and it found no clear bottleneck to stop the acceleration compounding.

The public cannot check this. Anthropic could approve or refuse each of METR's requests for data. METR says the access exceeded its expectations, but Anthropic redacted a majority of the evidence that METR found most informative, in order, Anthropic says, to keep it from rival developers. METR writes that the public "has to rely on METR's judgment much more than would be ideal". Planned Obsolescence, a blog by a METR staff member who did not work on the assessment, argues from the public version alone that the threshold looks to have been crossed already. Anthropic alone decides whether it has.

A lab's own checks can miss what matters. OpenAI found that GPT-6 Astra did worse on work framed as safety research, and its monitors, which read the model's chain of thought, did not catch it because the model seldom wrote down a decision to hold back. OpenAI deserves credit for publishing that. But it shows how little a lab's word on its own models can settle.

Anthropic should give the unredacted report to a public body able to read it, and let METR say in public whether, on everything it saw, the threshold has been met. A company that writes a trigger for runaway progress into its policy should not be the only judge of when it has been reached. ■

WHO GAINS Anthropic, which chooses what the public may see and decides when its own threshold is met, and METR, whose judgment now carries the weight of the evidence nobody else can read.

WHAT'S ABSENT The redacted evidence, METR's forecast for a future model and any government evaluator in the process.

AI gets a meter

Labs and their customers are rationing AI as prices fall faster than costs, and honest pricing by the task serves buyers better than discounts meant to lock them in

From December, subscribers to ChatGPT's paid plans will draw on a single budget of tokens across ChatGPT and Codex, according to an OpenAI support page. Over the Halloween weekend SpaceX cut the usage limits of its agent, Grok Bot. Elon Musk, its boss, said the cost of serving it was "unsustainably high relative to revenue". Apple and Goldman Sachs are rationing AI for their own staff. Unlimited prompting for a flat fee is ending, at the sellers' end and the buyers'.

Ramp's figures show why. Spending on tokens across its customers grew by 1.5% over August and September, against 42% in July alone, though volumes kept rising. Spending picked up by 8.9% in the month to 23rd October. Ara Kharazian, Ramp's lead economist, blames a price war. OpenAI halved the prices of GPT-6 Sol and GPT-6 Luna for developers in September, and Anthropic says in its filing that its own cuts reduced revenue growth by about $600m. Buyers have also learnt to set budgets and send simple tasks to cheaper models. It has become a buyer's market, Kharazian says.

This is better for buyers than what came before. Selling below cost to lock customers in is how ride-hailing grew, until rivals left and fares rose. Kharazian argues that AI has too many competitors, including cheap open models, for that to work. Customers who can see what each task costs learn to control it. For the labs it means slower revenue, and investors have marked down both OpenAI and Anthropic.

The labs should finish the change. They should publish a price per task that buyers can compare across providers, state each plan's limits in tokens instead of vague "usage", and drop discounts meant only to lock customers in. Investors pricing Anthropic's listing should judge it by what it earns on each task it serves, since that, more than the volume of tokens, decides whether the business pays. ■

WHO GAINS Buyers, who now pay less for each task and can switch between providers, and the makers of cheap open models and of routers that send work to them.

WHAT'S ABSENT A sample beyond Ramp's customers, among whom Kharazian says almost all AI spending comes from venture-backed tech firms, and any lab's own figure for what a typical task costs to serve.

LAB REPORTS

What the big labs announced. Every figure is the lab's own.

OPENAI

OpenAI offers to hand power back to the grid

OpenAI says it will pilot a "Grid Protectors Program" at a planned data centre in Effingham County, Georgia, freeing up to 1,000 megawatts during extreme weather or emergencies. *The Verge* says that is enough for the air conditioners of about 700,000 homes. OpenAI now calls its data centres "compute campuses" and argues that their steady, year-round demand spreads the grid's fixed costs across more sales. [theverge.com]

ANTHROPIC

Claude reads users' bank accounts

Anthropic has launched Personal Finance in beta for its Pro, Max and Ultra subscribers in America. Through Plaid, a service that links apps to bank accounts, Claude gets read-only access to balances and up to two years of transactions. Anthropic says Claude cannot move money, and that it will not train on these conversations or show ads. It wants to work with banks and licensed advisers next. [theverge.com]

META

Meta's Muse builds small apps on request

Meta is rolling out "spaces" to all users of Muse, its assistant. From a description, Muse builds a page such as a shopping hub or school dashboard and keeps it up to date from connected services such as Gmail and Google Calendar. Meta says it is also bringing the "Active Memory" and "Active Focus" features of its Muse Wonder model to the Muse app and to Meta AI. [theverge.com]

THINKING MACHINES

Thinking Machines releases a bigger Inkling

Thinking Machines, the start-up founded by Mira Murati, a former chief technology officer of OpenAI, says Inkling 2 Small has 594bn parameters, 17bn of them active at a time. It says the model scores 31 on Artificial Analysis's Intelligence Index, 18 points more than its predecessor. Artificial Analysis puts its cost at about $1.2 a task, nearly six times its predecessor's. It is offered first on the company's Tinker platform, with weights under an Apache licence to follow. [the-decoder.com]

GOOGLE

Google's video model makes longer, cheaper clips

Google has made Gemini Omni 1.2 Flash, its video model, generally available through the Gemini API and Gemini for business. It makes clips of up to 15 seconds, up from ten, and lets users edit a clip over several turns of conversation. It costs seven cents a second for 720p video, which Google says is 30% less than the previous version. [blog.google]

MISTRAL

Mistral puts Large 4 to work for companies

Mistral has added managed agents and apps, and tools to watch and evaluate them, to Studio, its platform for business agents and workflows. Studio runs in the cloud, in a customer's private cloud or on its own premises. Mistral says customers including BNP Paribas, Accenture and Capgemini already use it in production, with Mistral Large 4, which it calls Le Chonk. [mistral.ai]

PREFERRED NETWORKS

PLaMo's translation models go open

Preferred Networks, a Japanese AI company, has published the weights of its four PLaMo 3 Translate models, from 0.8bn to 31bn parameters, covering 53 languages. It says even the smallest beats translation models more than 30 times its size between Japanese and English. Smaller firms may use them commercially for free. [preferred.jp]

SPACEX SUPER INTELLIGENCE (XAI)

xAI gives every team a data bot

SpaceX's AI division says its data scientists built Data Bot, a shared agent in Grok Bot that queries the company's data warehouse, runs analyses and answers colleagues in Slack. The data team maintains its skills and approves or rejects what it proposes to add to its shared memory. [x.ai]

SCIENCE & TECHNOLOGY

A small text model learns to see as vision models do

Balestriero and LeCun prove when separately trained models learn the same picture of the world, and a text model of 109m parameters trained that way outdoes language models of 72bn

Models trained only on images and models trained only on text can learn the same picture of the world, provided each learns from two observations of one scene, such as two photographs or two captions of the same photograph. Randall Balestriero of Brown University and Yann LeCun of New York University, both also at AMI Labs, a start-up, prove this for one family of models. These joint-embedding predictive architectures (JEPAs) learn by making their internal representations of two related inputs agree. Under the authors' conditions the representations learned from each kind of data are identical up to a rotation, so one simple mathematical map translates the one into the other.

The proof turns an observation into a recipe. Other researchers had noticed that the internal representations of vision and language models grow more alike as the models grow, and called this the Platonic representation hypothesis, after the shadows in Plato's cave. Balestriero and LeCun argue that next-token prediction, the method that trains today's language models, is a JEPA fed poor pairs: it matches the start of a document with its continuation, two parts of one observation. A model trained that way spends capacity on the quirks of language, which no rotation can match to an image, and so lines up with vision models only partly, and mostly through sheer size.

The experiments support the argument. The authors trained text models on descriptions of 940m web images and measured how closely their representations matched those of DINOv2, a widely used image model. Trained on pairs of captions of one image, a text JEPA reached after about 22m training samples the alignment that next-token prediction reached after 900m, a 42nd as many. With all 900m samples, a text model of 109m parameters matched DINOv2 better than every language model the authors tested. These ran up to Qwen2.5-72B, which is 660 times larger and was trained on over 100 times as much text. A formula fitted to their runs predicted the results of 85 new runs before they were trained, about as accurately as repeating a run with a different random seed.

The theorems describe idealised conditions, a finite world observed without loss and perfectly trained models, and none of the experiments meets them exactly. The largest caveat is where the pairs of captions come from. In the biggest dataset two of each image's three captions were written by a captioning model. Its vision component was trained on images paired with text, so some knowledge of images reaches the text model through them. Without such generated captions, alignment fell by almost half. The comparison between kinds of training, on identical texts, does not depend on this. If the result holds at larger scale, the way a model's training pairs are chosen could buy what labs now pay for with size. ■

Proving and Improving the Platonic Representation Hypothesis with JEPAs

Trained agents need room to recover

Reinforcement learning mainly makes AI agents better at recovering from mistakes, so its gains shrink or vanish when they are allowed few turns

Training AI agents with reinforcement learning[2] mainly makes them better at recovering from mistakes, so their advantage depends on how many turns they are given. Researchers at the Chinese Academy of Sciences and Tsinghua University trained Qwen3 models of 4bn and 8bn parameters on four interactive tasks, among them a grid puzzle, coding and database queries. Then they varied the limit on turns. With plenty of turns the trained agents clearly beat the untrained model. With few, their lead shrank, and on some tasks it reversed.

Faced with the same situation, the trained agents chose the better next move in fewer than half the cases the authors could score. After an injected error, though, they went on to solve a coding task 39% of the time, against 23% for the base model. The authors' remedy, BudgetMix, trains each attempt under a randomly drawn limit of turns. At a quarter of the maximum it beat standard training by 7.5 percentage points on average, and it matched standard training when agents had every turn. Agents in use often work under tighter limits than they were trained with. Only small open models were tested, and the authors call their remedies preliminary. ■

What Does Multi-Turn Reinforcement Learning Really Improve in LLM Agents?

A reasoning model learns when to stop

Taught to prefer shorter endings at the points where it starts to overthink, a 7bn-parameter model cut its maths answers by over 40% without losing accuracy

A reasoning model can be taught to stop deliberating once it has enough to answer, without getting less accurate. A team from Xi'an Jiaotong University and Tencent's WeChat AI applied their method, LoCo, to DeepSeek-R1-Distill-Qwen-7B, a model of 7bn parameters. LoCo finds the steps in the model's own working where it begins to overthink and keeps the reasoning up to each such point. The model then writes shorter endings from there that still reach the right answer, and is trained to prefer them to its long originals.

On five maths benchmarks the trained model wrote 42–45% fewer tokens, with accuracy as good as before or better. On the 30 problems of the 2024 American Invitational Mathematics Examination, a competition, it was right 54% of the time against 51% for the original model. Its answers shrank from about 13,500 tokens to 7,400. Although trained only on maths, it also wrote 23–36% less on three coding benchmarks without losing accuracy. Shorter reasoning makes answers cheaper and quicker to produce. But the method was tested on that one model only, and the hardest test sets are small. ■

Think Less, Locally: Local Preference Learning for Reasoning Compression

OFF THE RADAR

Work that matters, from writers the big outlets missed. Every claim is the author's.

Voters dislike the AI industry itself, a Berkeley professor argues

Ben Recht, a professor of electrical engineering and computer sciences at the University of California, Berkeley, and co-author of the textbook "Patterns, Predictions, and Actions"
arg min · *"Less Popular Than Coal"* · Nov 4

Recht argues that the votes against data centres show that Americans dislike the AI industry as a whole, and that the buildings are only its most visible sign. He says adoption and economic gains are so concentrated in a few hands that they bring no tangible benefit to most people. He asks the people who build AI models to demand a better direction from their employers, and says an open letter does not count. [argmin.net]

WHY IT WAS MISSED a short post on his own newsletter

American states copy each other's rules for AI in schools

Shahan Ali Memon, Jevin West and four co-authors, a team whose senior member, West, is a professor at the University of Washington's Information School and founding director of its Center for an Informed Public
arXiv · *"U.S. State Guidance on AI in K-12 Education: A Comparative Content and Citation Analysis"* · Nov 4

The authors compared the AI guidance for schools published by 35 states and Puerto Rico, and found that 97% of the documents address data privacy and academic integrity but few say how to act or who is accountable. They say some states copy the model guidance of TeachAI, a non-profit, almost word for word. By their count no state lists parents among the authors of its guidance, and only five list students. [arxiv.org]

WHY IT WAS MISSED a preprint under review that no outlet has covered

WORTH READING

Both parties ran against data centres

Ben Thompson · Stratechery · *"AI on the Ballot"* · **Nov 4**

Thompson found data centres the commonest topic of Wisconsin's campaign ads and asks what lasting American opposition to building would mean for tech. [stratechery.com]

Why AI has changed coding more than law

Timothy B. Lee · Understanding AI · *"This robotics concept helps explain the jaggedness of frontier capabilities"* · **Nov 5**

Lee borrows the robotics gap between simulation and reality to explain why gains in code and maths have not spread to other professions. [understandingai.org]

Watching AI models bluff each other

Dwarkesh Patel · Dwarkesh Podcast · *"The benchmark where AIs have to lie to win"* · **Nov 5**

Patel spent about $20,000 having models play a game of hidden roles, which shows how well they scheme together and where their long-range planning fails. [dwarkesh.com]

A sceptic reads the weight-editing claims

Sean Goedecke · seangoedecke.com · *"LLMs are not superhuman at reading and writing neural network weights"* · **Nov 3**

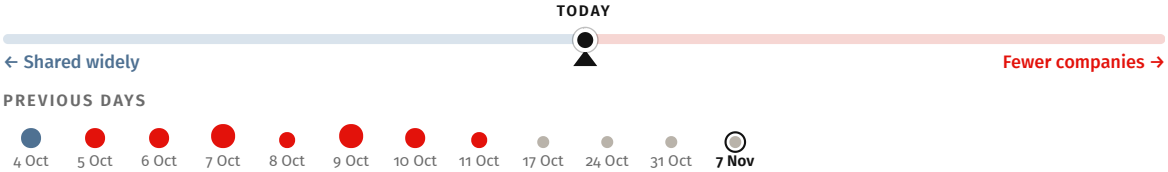
Goedecke argues that a capable human researcher could do what a recent paper presents as GPT-6 Astra's superhuman work on a network's weights. [seangoedecke.com]

THE SCALES

Is power over AI held by fewer companies, or shared more widely?

Each day we look at the news and ask which way it moves this balance.

No clear change



Last 7 issues: 3 toward fewer companies, 4 no clear change

Compared with 31 Oct: **no change**

Power over AI moved neither way on balance this week. Voters across America took a say over where data centres are built, a price war cut what companies pay the labs, and investors marked down both OpenAI and Anthropic. Against that, SpaceX, Aramco and Marvell gathered more of the infrastructure, closed models took back the lead on value and Anthropic redacted most of the evidence that METR found most telling in the only outside audit of its acceleration. Of 53 stories, 39 are American, six Chinese, three European, one Japanese and four from elsewhere.

HOW WE ASSESS THIS This is our editorial assessment, not a precise measurement. We read news from the US, Europe, China, Japan and Korea, and judge whether each story gives more control to a few companies or spreads it out.
